

# MY WISHLIST

## Modules

- ☒ Arduino
- ☒ SD module
- ☒ SD card
- ☒ RTC module
- ☒ Coin cell
- ☐ 5V up/down
- ☐ Batt holder
- ☐ Batteries
- ☒ ~~Protoboard~~
- ☐ Enclosure

## Product Details and Comment

### TINYSHIELD REAL-TIME CLOCK

Add low power real time keeping to your TinyDuino (Model ASD2831)

Please, enter your comments...

### TINYSHIELD MICROSD

Add huge amounts of storage with the TinyShield microSD Adapter.(Model ASD2201)

Please, enter your comments...

### TINYDUINO PROCESSOR BOARD

The Heart of the TinyDuino Platform (Model ASM2001)

Please, enter your comments...

### TINYSHIELD USB

Connect your TinyDuino to your computer for programming. (Model ASD2101)

Please, enter your comments...

### TINYSHIELD PROTO BOARD

All of TinyShield Signals with 0.1" Spacing (Model ASD2009)

Please, enter your comments...

### TINYDUINO MOUNTING KIT

Mounting Kit for the TinyDuino (Model ASH1002)

Please, enter your comments...

### MICROSD CARD (8 GB) AND SD ADAPTER

microSD Card (8 GB) and SD Adapter

Please, enter your comments...

• \$100.19 @ 1 pc.

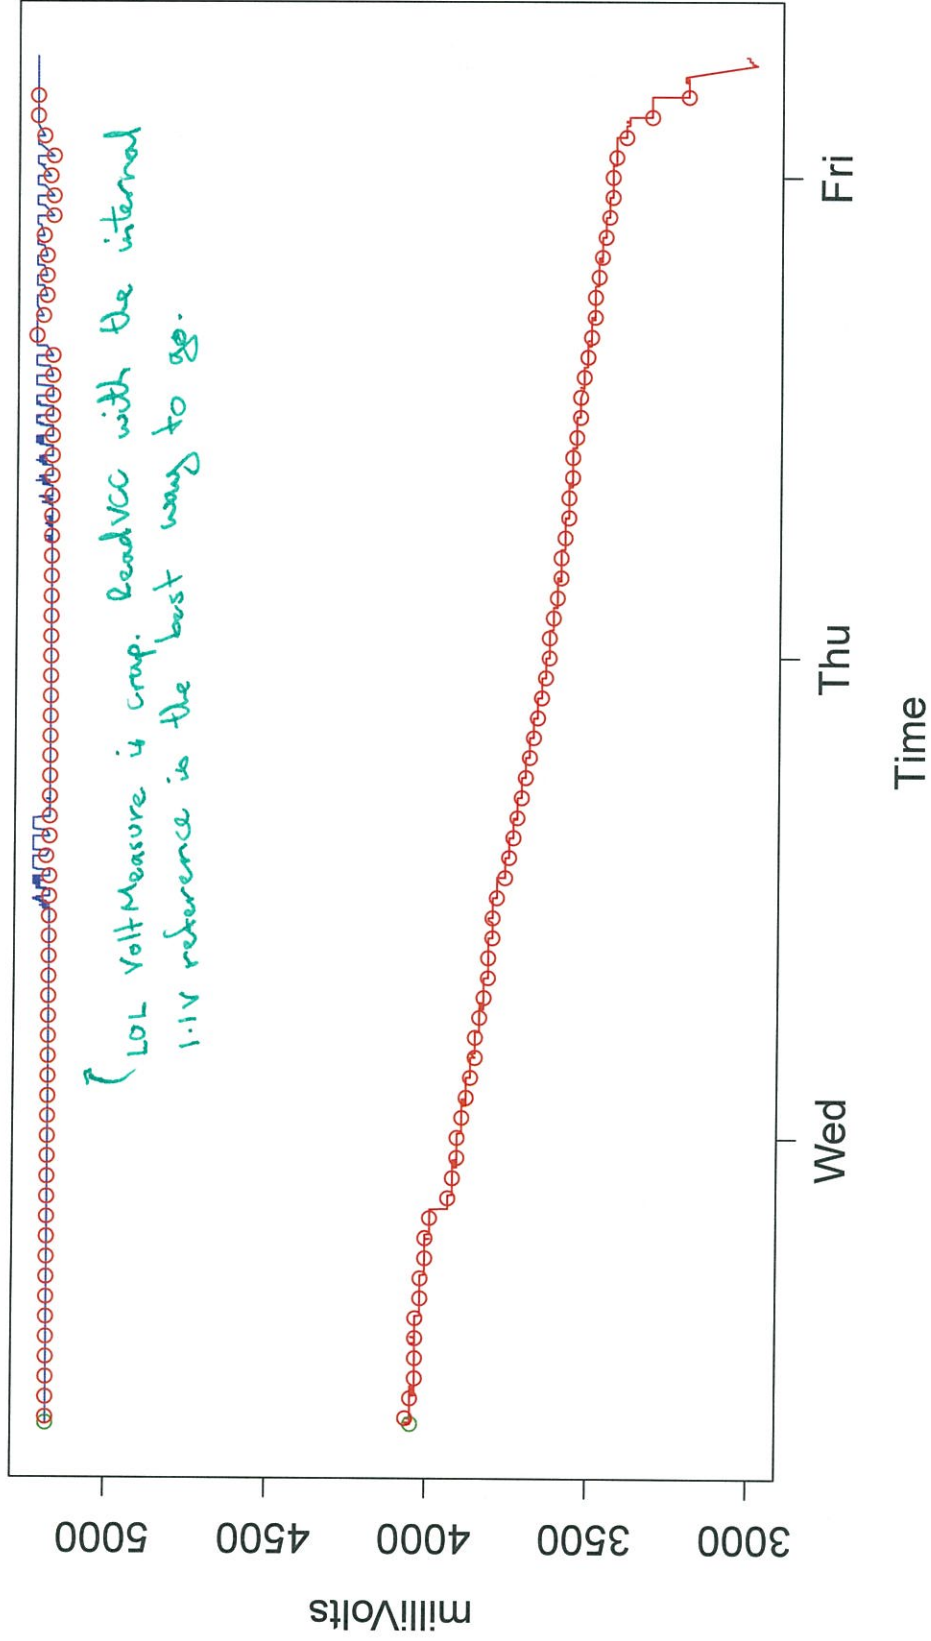

+ \$10.00 enclosure

+ fudge factor

= \$120.00 @ 1 pc.

## voltMeasure (blue) vs. readVcc (red)

40 mAh battery test. With a safety shutdown set at 2600 mV, RRC and SD never became unsafe (the log recorded about 10 logs with the same time stamp and Vcc below 2800 mV) but no data were lost. VCC according to 1.1V internal reference

logger battery life.

Experiment ran for 78 hours continuously.

Energizer Max is supposed to be 2500 mAh, but Energizer's own test showed 50 hours service life in a remote (50 mA drain?).

$$2000 \text{ mAh} = 2000 \text{ mA} \times 1 \text{ h} \rightarrow \frac{\text{mAh}}{\text{h}} = \text{mA}$$

Apparently, I was draining 32 mA.

With Tinyduino alone connected and measuring amperage at the battery before it's stepped up, drawing 21 mA.

So it's my step-up that's costing me battery life. I need to ship it, perhaps by just using 3x batteries together. Even with the reduced voltage range, I should be able to get more life with less power draw.

Alternatively, I could do a hybrid system where I use a forward-biased Zener to only allow voltage through

TinyDuino power draw:

Processor board, pin 13 LOW, empty program; 1N4007 protection diode	5.74 mA.
" " " without protection diode.	8.68 mA.
Processor, RTC, no protection diode.	9.10 mA.
Delay 8sec, flash LED 13 for 0.5 sec.	8.90 mA
Sleep. powerdown for 8 sec, flash LED 13 for 0.5 sec.	0.04 mA
" above " with unbranded microSD card (2GB).	0.77 mA
" above " with Kingston 8GB card.	0.70 mA
" " Sandisk 32GB Extreme Plus.	0.96 mA
" " unbranded 1GB microSD card.	0.92 mA
Prototype with unbranded 2GB microSD card	17.00 mA
